How long do Czech women stay out of the labour market after giving birth?

Bičáková, A., Kalíšková, K. (2015). Od mateřství k nezaměstnanosti: Postavení žen s malými dětmi na trhu práce [From maternity to unemployment: Position of women with small children in the labor market]. IDEA studie 8/2015.

Does the long parental leave of Czech women lead to unemployment?

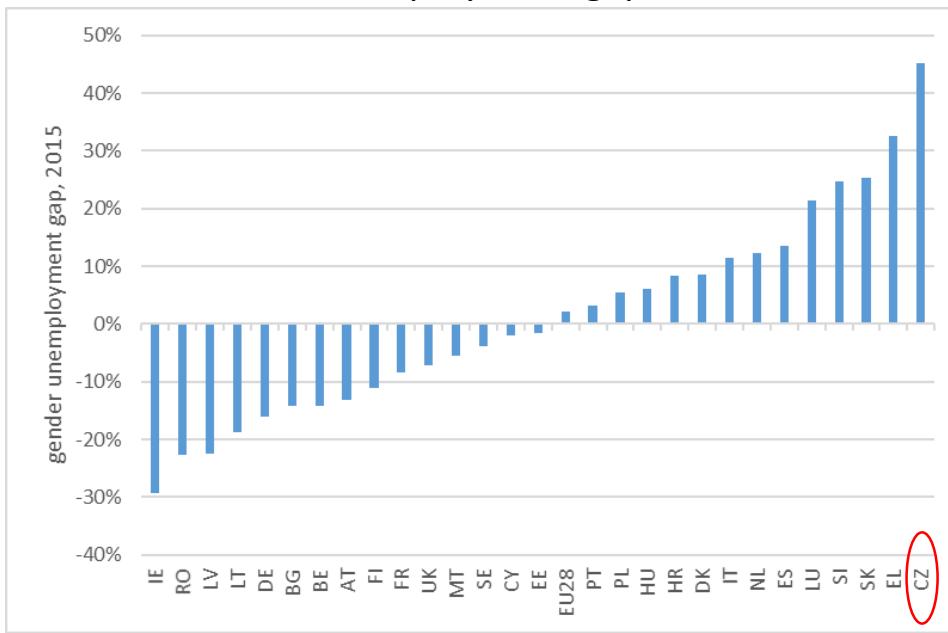

- Yes, the unemployment rate is high mainly for women with children at the age of 2 and 3.
- Most women return back into the labour market **when the child is 3 years old** when the **unemployment rate reaches 12% for women with higher education** and **28% for women with lower education.**

High unemployment of mothers with small children is unique in international comparison.

- The Czech Republic has the largest gap between female and male unemployment rate in the EU (4.2 vs. 6.1% in 2015). The cause seems to be the parenthood.

Gender unemployment gap, 2015:

Unemployment-to-population ratio, 2014:

	Men	Women
Without children younger than 15	4.2 %	4.9 %
With children aged 0-6	2.8 %	6.4 %
With children aged 4-6	2.8 %	10.9 %

Parental leave reforms: (Un)Intended consequences in the labor market

- Very long paid leaves may negatively affect job continuity
- Czech reforms of parental leave policies:
 - 1995 – duration of benefit receipt prolonged from 3 to 4 years
 - 2008 – opportunity to shorten benefit receipt to 2 or 3 years
 - job protection kept at 3 years
- Findings:
 - Surprising **high take up** of the 4-year paid leave (38% of women prolonged leave beyond 3 years) after 1995
 - Unintended effects: **1995 reform increased post-leave unemployment by 6 p.p. and post-leave inactivity by 7 p.p.** among high-educated women

Bičáková, A., and Kalíšková, K. (2019). (Un)intended effects of parental leave policies: Evidence from the Czech Republic. *Labour Economics*, 61, 101783.

Very long parental leaves and child outcomes: Is longer maternal care always beneficial?

- Impact of the 1995 reform on long-term child outcomes
- Extending paid leave from 3 to 4 years has the following impact on children at the age of 21-22:
 - children of low-educated mothers are 10 p.p. **less likely to be in tertiary education or have a tertiary degree**
 - girls of low-educated mothers are somewhat more likely to do **housework** (inactivity)
- Spending extra year with a (low-educated) mother at the age of 3 might negatively affect human capital investments later on (especially for girls)
 - In line with literature that finds positive effects of universal childcare on child outcomes
